Intelligent Repository

Extracting Value

CDA Data Challenge

Workflow and outputs

Collect

- Extract meaningful information
- Group results in logical manner
- Identify data gaps
- Presented as a searchable index
- Improved classification and contextual information

Harmonize

- Spatially related
- Co-relate all data
- Harmonised dictionaries
- Parsed, QC'ed & corrected
- Apply Machine Learning
- Write back to original source

Optimise

- Composited Well Log dataset
- True depth, true deviation, true location
- Data in stratigraphic context
- Cross check results against extracted information

Interpret

- All geological data mapped in TVD
- Understand how the local correlate. Fill in the gaps of what happens in between
- Apply machine learning to auto-interpret log sets
- Basic interpretations completed

Consume

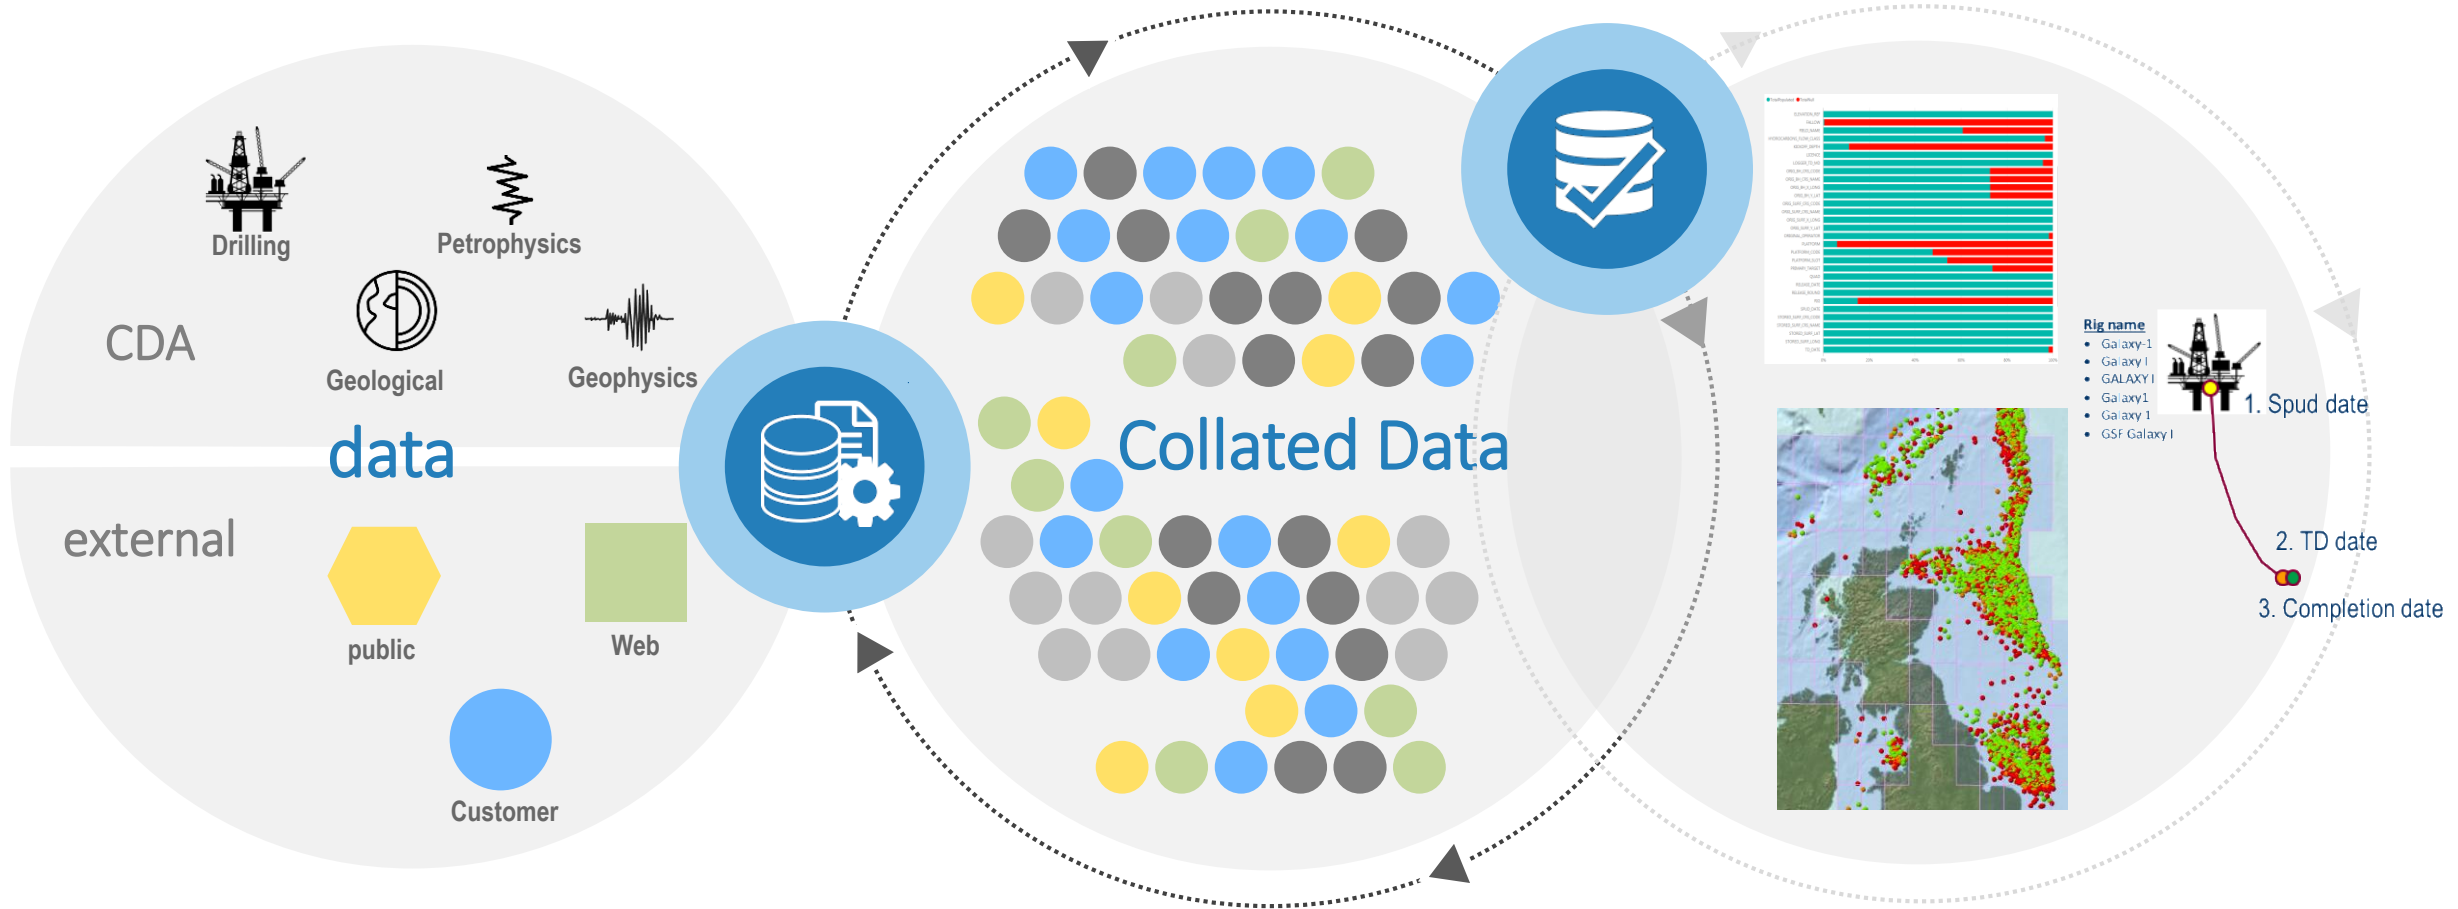

- Optimised logs in spatial, and stratigraphic context
- Detailed knowledge of the reservoir characteristics at and between the wells
- Fine scale reservoir variations
- Automated field level studies
- Generate "missing" data

Automation Log QC Workflow

BEFORE
30% of the well data had units that were either statistically inconsistent or unrecognized

Distribution of all the well Neutron Porosity values: unexpected spike between 0 and 0.01 corresponds to data where the unit was mislabeled as %

Neutron Porosity Units

AFTER
Only 1% of the well data required manual intervention after the automated process was run

Neutron Porosity distribution for well data after applying machine-learning based unit correction. Spike at 0.03 corresponds to halite/salt formations

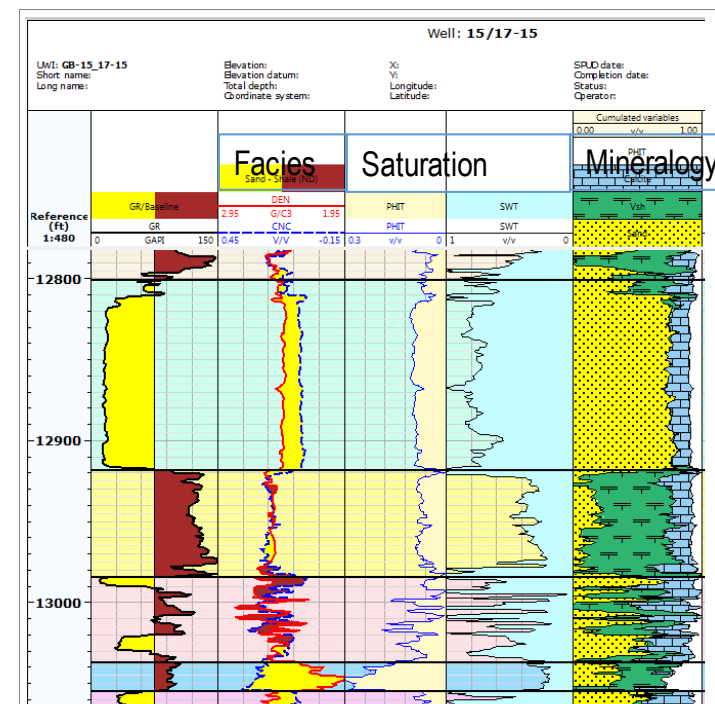

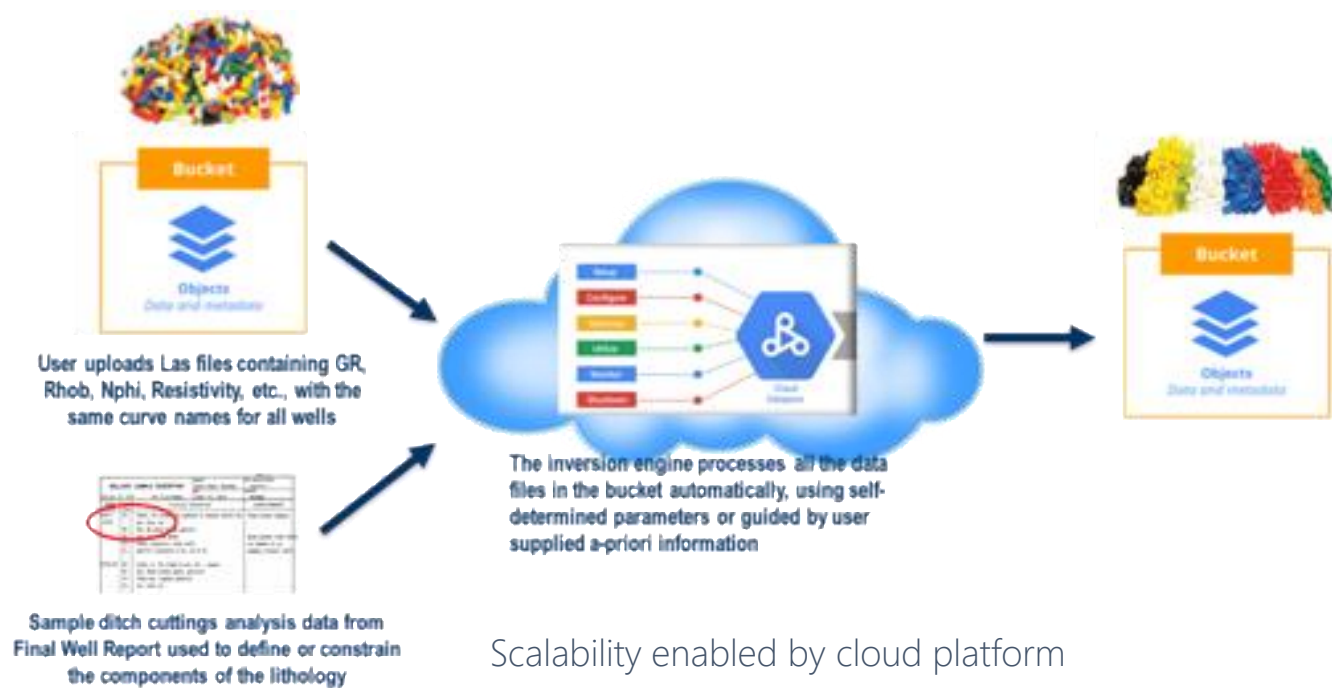

Neutron Porosity Curve Names

Harmonised and optimised LQC Dataset
Auto-correction applied for >2000 Wells

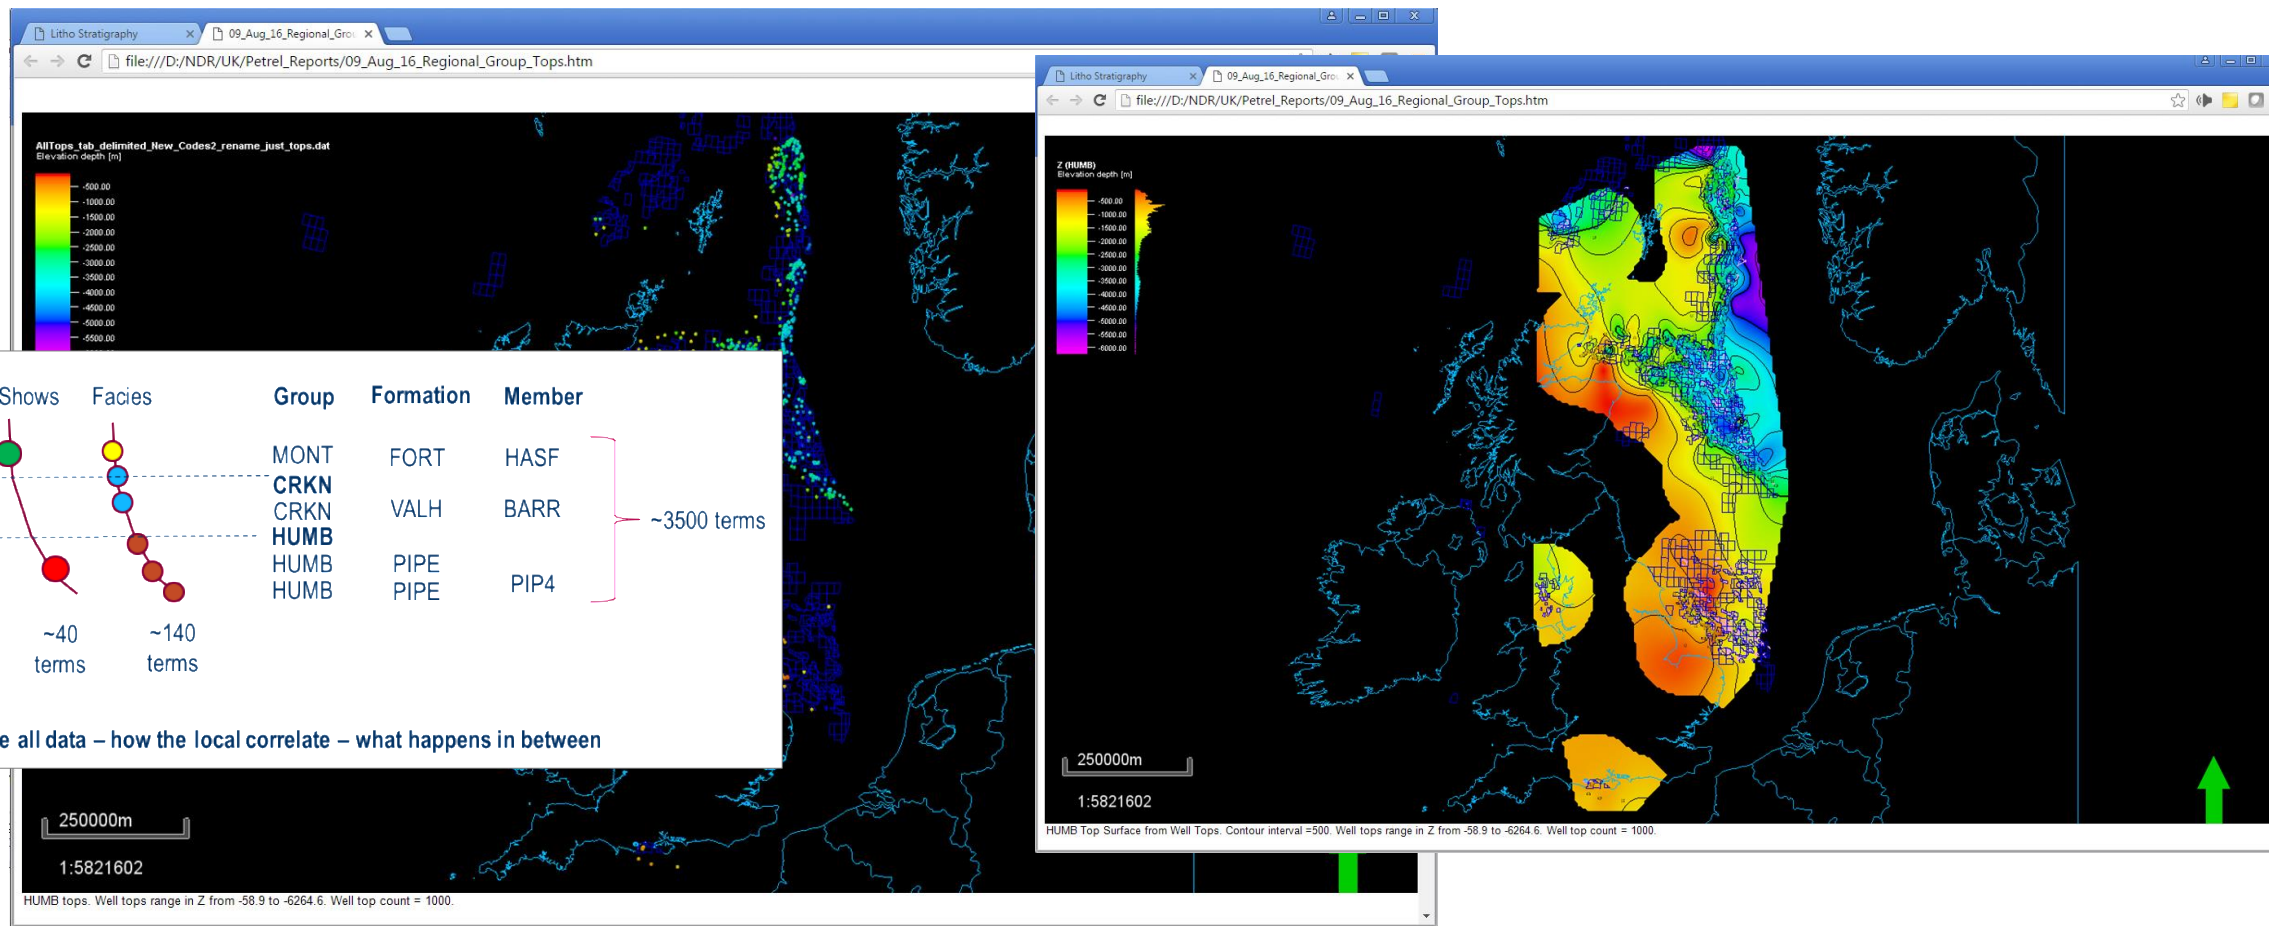

Automation

Petrophysical Analysis

Detailed Petrophysical analysis
– 46 wells across Piper field

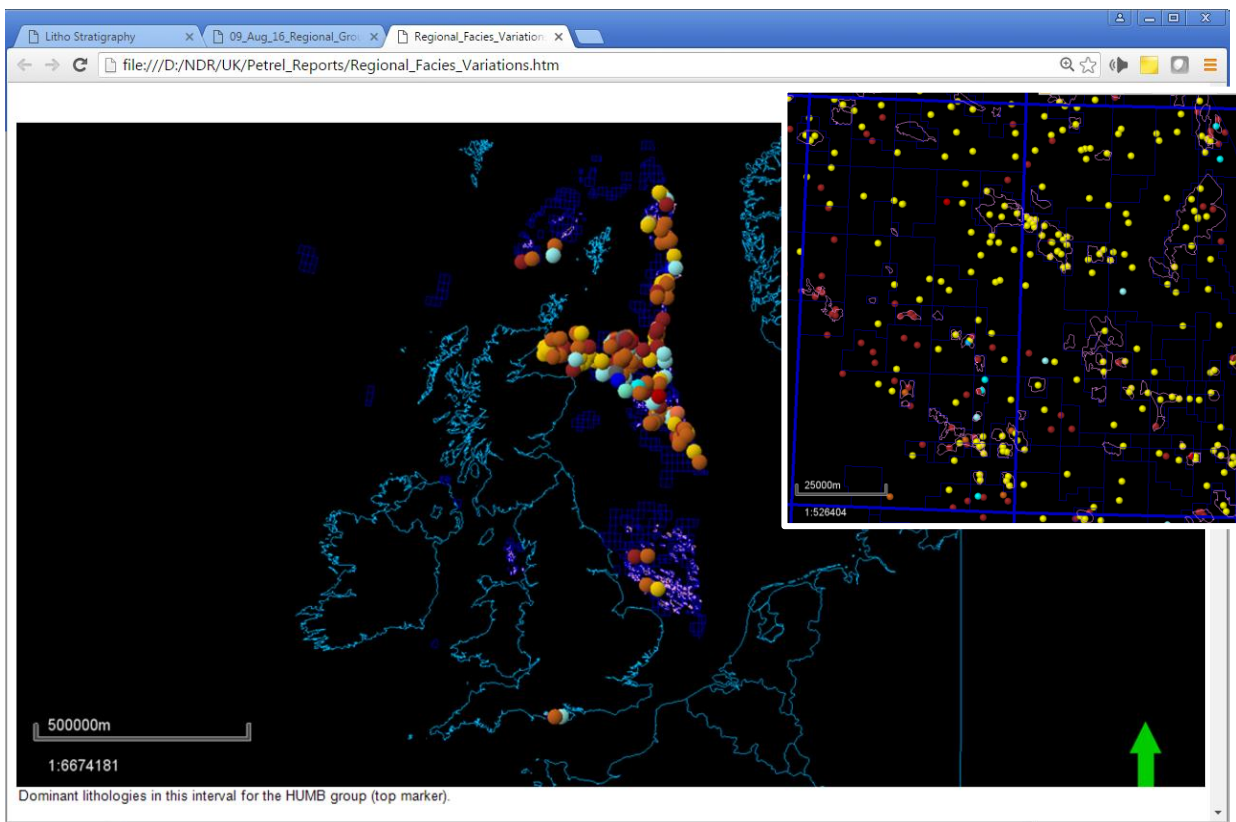

Understanding Automated mapping across the UKCS

Youngest units

Understanding Hydrocarbon System and Business Opportunities

- Sands
- ● Silts to shales (& coals)
- Carbonates
- Igneous and metamorphic

- Oil shows
- Other HC shows
- No HC Shows

Size: 5.75 MB

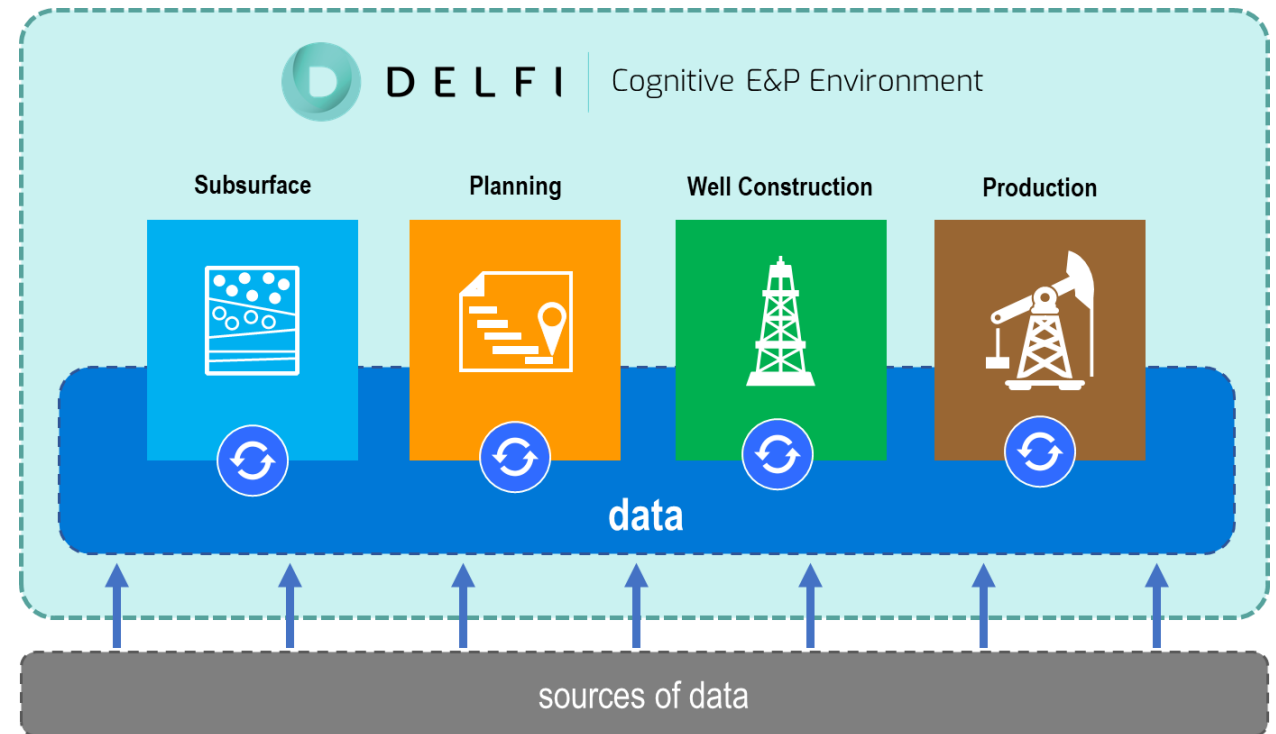

Summary:
This resulted in detailed drilling information being available on a "need to know basis". Some difficulty was encountered with high torque and hole fill resulting in the hole having to be drilled with a 26" bit and then opened to 36". This phase was completed in 48 hrs, which can be improved significantly Observations The original BHA for this section included a 36" stabiliser, which may have added to

Classification:
Well Drilling | Drilling Fluids and Materials | Drilling fluid management disposal

our data vision

Create the **industry leading E&P data ecosystem** to enhance and augment E&P digital solutions to deliver **domain insight, innovation & enhanced value** for our customers workflows

- **Data-enriched domain workflows**
- **Data-driven environment**
- **Open and extensible**
